

Shopping Cart Page (newly added):

Lo-fi prototype

I sketched out the page structure in the lo-fi prototype. Some key design choices I made were:

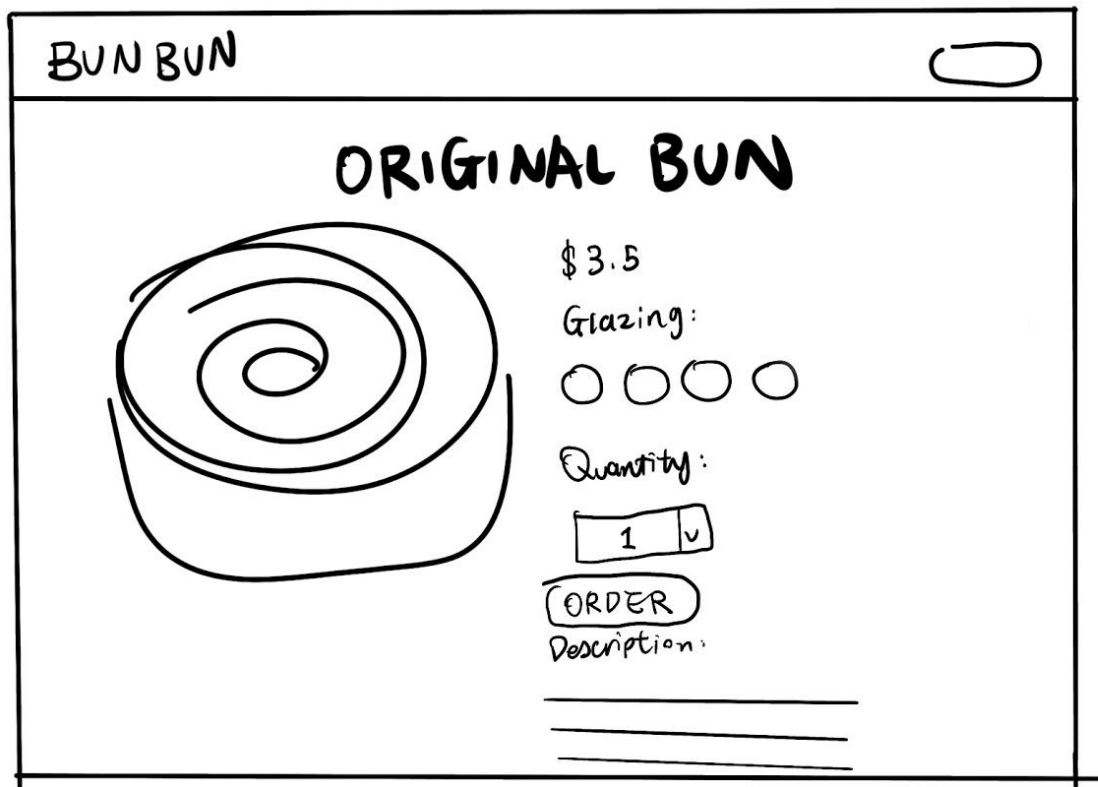

- On the left, the main content with items in the cart listed out. There's a functionality to modify the quantity in the cart. This would make the modification much more efficient
- On the right, side content with order summary and checkout button
- The navigation bar stay the same

Hi-Fi prototype

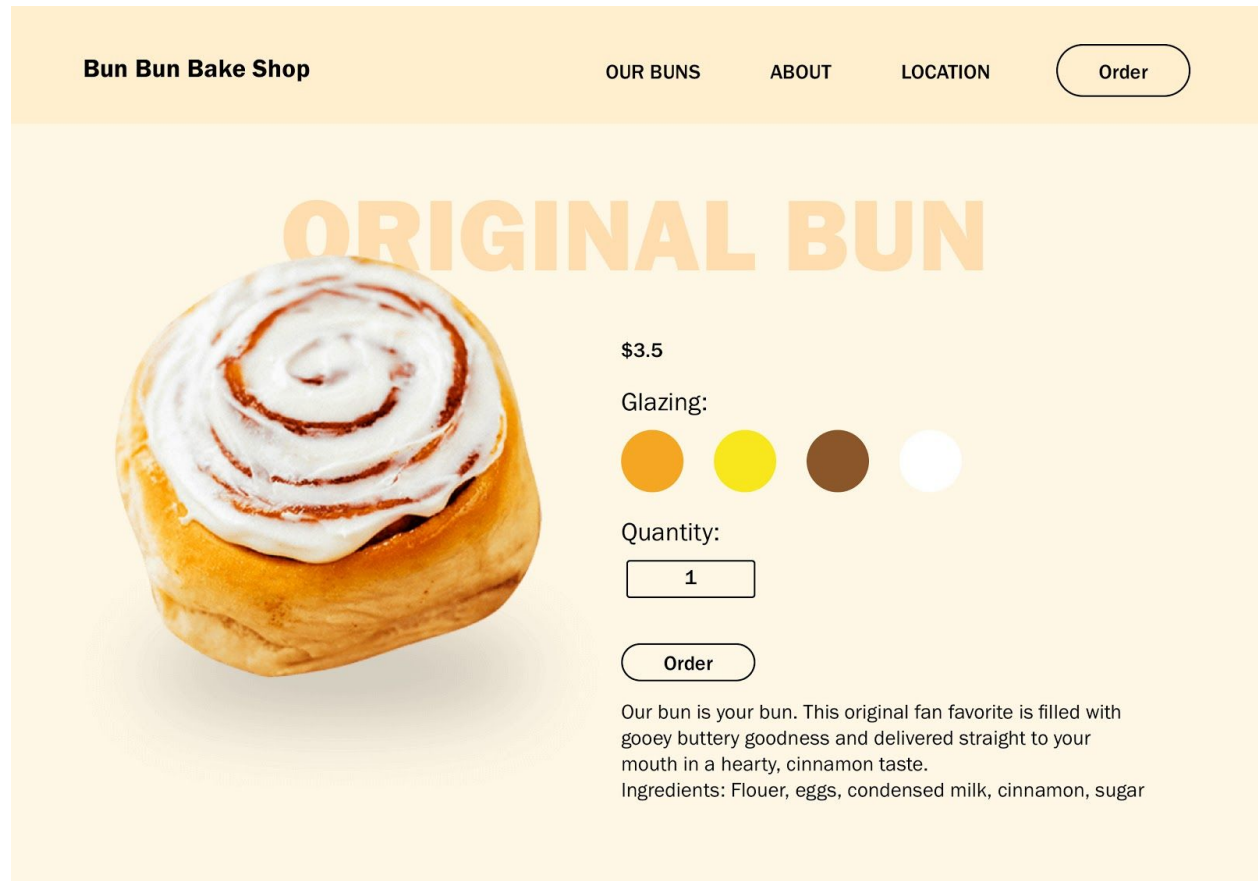

The hi-fi prototype mostly follows the low-fidelity prototype drawn above. With more consideration of my html and css structure, I changed the layout of item information a little bit so it would be more realistic to execute the code.

Product page(modified):

Lofi prototype

I realized that in my old prototype, “order” section was not the most efficient way to add items to the cart, so I decided to modify my product pages a bit to add full functionality for adding items to the cart. Therefore, users are able to choose glazing and quantity and add items to the cart just on the product page. To keep the integrity of the original prototype, the new functions simply follows the same structure of the page, and the description is moved to the bottom.

Hi-fi prototype

In the hi-fi prototype, I tried to make the styling consistent with the original code.
